Brachial Plexus Injuries

Obstetrical brachial plexus injury (OBPI) is an injury in newborns, thought to be sustained during labour and delivery. 1 Incidence is estimated to be between 1.6 and 2.6 in 1000 births, 2 equivalent to autism 3 and congenital deafness. 4 It is greater than for type 1 diabetes mellitus 5 and cystic fibrosis. 6

Brachial Plexus

Obstetric brachial plexus injury is the flask

paralysis of the arm, which emerges from a difficult birth. This results from the damage to the nerves from the C5 cervical root to T1.

compressed, or in the most serious cases, ripped apart or torn away from the spinal cord.

Minor brachial plexus injuries, known as stingers or burners, are common in contact sports, such as football. Babies sometimes sustain brachial plexus injuries during birth.

Brachial plexus injury -

File Type PDF

Obstetric

Symptoms and causes -

Mayo Clinic

Brachial plexus injury is an uncommon complication of delivery, reported in 1.5 of 1,000 total births. 1 Brachial plexus injury occurs as a result of stretch or tearing of the C5-T1 nerve roots and may be associated with shoulder dystocia.
