This book is a complete guide to the Sony Cyber-shot DSC-HX80 and HX90V cameras, two highly versatile, and pocketable, superzoom models, which offer a 30x optical zoom range from 24mm to 720mm. With this book, author Alexander White provides users of these two very similar models with a manual covering all aspects of the cameras' operation. Using a tutorial-like approach, the book shows beginning and intermediate photographers how to take still images and record video with the HX80 and HX90V, and explains when and why to use the cameras' many features. The book provides details about the cameras' automatic and advanced shooting modes as well as their menu options for shooting, playback, setup, and using Wi-Fi connections with in-camera apps. The book has more than 400 color photographs that illustrate the cameras' controls, display screens, and menus. The images also provide examples of photographs taken using the cameras' Scene mode, with settings optimized for subjects such as landscapes, sunsets, portraits, and action shots; and the Creative Style and Picture Effect menu options, with settings that alter the appearance of images. The book also provides introductions to topics such as street photography, macro photography, and getting the most benefit from the superzoom lens. The book includes

Digital cameras, both in traditional form factors and as parts of cell phones, have become ubiquitous over the last decade. But for the most part, they remain black boxes to the end-user, and cannot be reprogrammed or modified. This has become an obstacle to researchers in the new field of computational photography, who want to use the growing computing power of digital cameras to create images no traditional camera could produce. This dissertation presents the Frankencamera platform, a digital camera system designed for computational photography. The Frankencamera is a fully open, fully programmable digital camera, which can be easily modified to test out new research ideas. The Frankencamera architecture allows for per-frame control of the capture process, and accurate synchronization of all the components that make up the camera. Based on this architecture, this dissertation details two hardware platforms: the F2, a flexible custom-built camera; and the Nokia N900, a commercial smartphone. Both platforms can be easily programmed at a high level using the FCam API, written to embody the Frankencamera architecture. Finally, this dissertation presents several sample applications for the Frankencamera platform. Several of these applications could not have been developed for any existing camera platform, and the ease and speed at which they were

written show that the Frankencamera platform is a compelling tool for computational photography.
